The invuseful in developmental biology and in elucidating cell signallicell-cell interactions in higher eukaryottes for the development insecticides, therapeutics and pharmaceutical drugs. The inventi discloses genomic DNA sequences (ABL16176-ABL30511), expressed Discussions (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                          The present sequence encoding for novel human cell regulatory protein CC is an apoptosis-associated protein comprising a BH3 domain (AAU00417). CC A homologous mouse p193 protein (AAU00415) is also described. The p193 protein is useful as a target for modifying the G1 phase of the cell cycle of a mammalian cell, preferably human and for inducing apoptosis CC in an inappropriately proliferative cell. A nucleic acid encoding p193 is CC polynucleotide sequence into mammalian or other eukaryotic cells such as CC cardiomycoytes, hepatocytes, smooth muscle cells, haematopoietic stem CC cardiomycoytes, hepatocytes, smooth muscle cells, haematopoietic stem CC is useful in the study and understanding of the cell cycle, in screening CC aspects of the cell cycle, or in the culture of cells naving suppressed apoptotic activity and/or increased proliferative potential for cardiomycoytes or a mixture of all these cells are genetically modified CC acids which are delivered to the subjects in a damaged or diseased area of the heart in cases of myocardial infarcts and cardiomyopathies.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB BG

**PSEUDOMONAS** 

```
APPLICANT: MAIC J. Rubenfield et al.

APPLICANT: MAIC J. Rubenfield acid sequences relating to pseudomonas;

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS;

FILE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 10250

TYPE: DNA

ORGANISM: Pseudomonas aeruginosa

US-09-252-991A-10250
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US-09-252-991A-10250/c

//note="Wector: Lambda Uni-ZAP XR, excised phagemid;
Site_l: EcoRI; Site_2: XhoI; Plants were grown in the
greenhouse. Anthers were harvested and pooled from early
meiosis to late meiosis. The tissue, total RNA, and
poly(A) RNA were prepared (Butler, Ross and Gustafson) at
University of Missouri, Columbia. A cDNA library was
made, and the CDNA clones were in vivo excised to give
pBluescript phagemids in the TJ Close lab (Choi, Close,
Fenton) at the University of California, Riverside.
Pensmid DNA preparations and DNA sequencing were performed
in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 r: Stratagene SK primer.

/lab host="E. coli SOLR"
/clone lib="Secale cereale anther cDNA library"
/clone lib="Secale cereale anther cDNA library"
/note="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: EcoRI; Site_2: XNoI; Plants were grown in the
greenhouse. Anthers were harvested and pooled from early
meiosis to late meiosis. The tissue, total RNA, and
poly(A) RNA were prepared (Butler, Ross and Gustafson) at
University of Missouri, Columbia A cDNA library was
made, and the CONA clones were in vivo excised to give
pBluescript phagemids in the TJ Close lab (Choi, Close,
Fenton) at the University of California, Riverside.
Plasmid DNA preparations and DNA sequencing were performed
in the OD Anderson lab (all others)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              // Note="Vector: lambdaZAP; Site 1: EcoR1; Site_2: Xho1; // Note="Vector: lambdaZAP; Site_1: EcoR1; Site_2: Xho1; // Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystaatin and cefcotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 5oC for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was gurified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main ). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and

/note="Vector: pBluescript SX+; Site_1: EcoRI (5'-end of cDNA); Site_2: XhoI (3'-end of cDNA); Approximately 5 % of the clones correspond to cDNA from the fungi B. graminis hordei and tritici, respectively. Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, Sall, Pstl). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable. Average insert size is 1.2 kb"

DAP(days after pollination). Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRI asded pter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI, PatI). NOTE: Also due to the cloning system used Blue/white selection for recombinate is not 100% reliable.Average insert size is 900 bp"

/note="Vector: pBluescript SK+; Site_1: EcoRI (5'-end of cDNA); Site_2: XhoI (3'-end of cDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI Site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI,PstI). NOTE: Also due to the cloning system used Blue/white selection for recombinate is not 100% reliable."
